

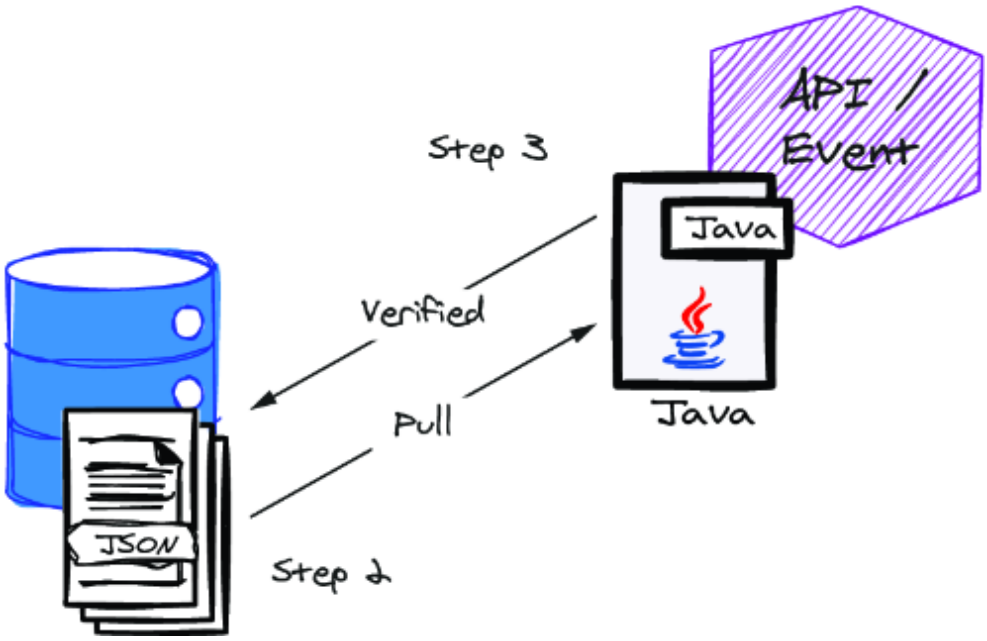

Figure 3.7 The provider Java test code verifies the contract and publishes the result to the broker.

Finally, we return to the consumer that created the contract. As part of the final step during the deployment of the JavaScript application CI pipeline, they check the broker to determine whether they can deploy their changes safely using the can-i-deploy tool, as shown in figure 3.8. The tool checks the verification status on the contract, ensuring that the Java API or event service has confirmed that their HTTP request is valid and matches the response they expected. Once the changes are confirmed, the consumer deploys the changes.
