

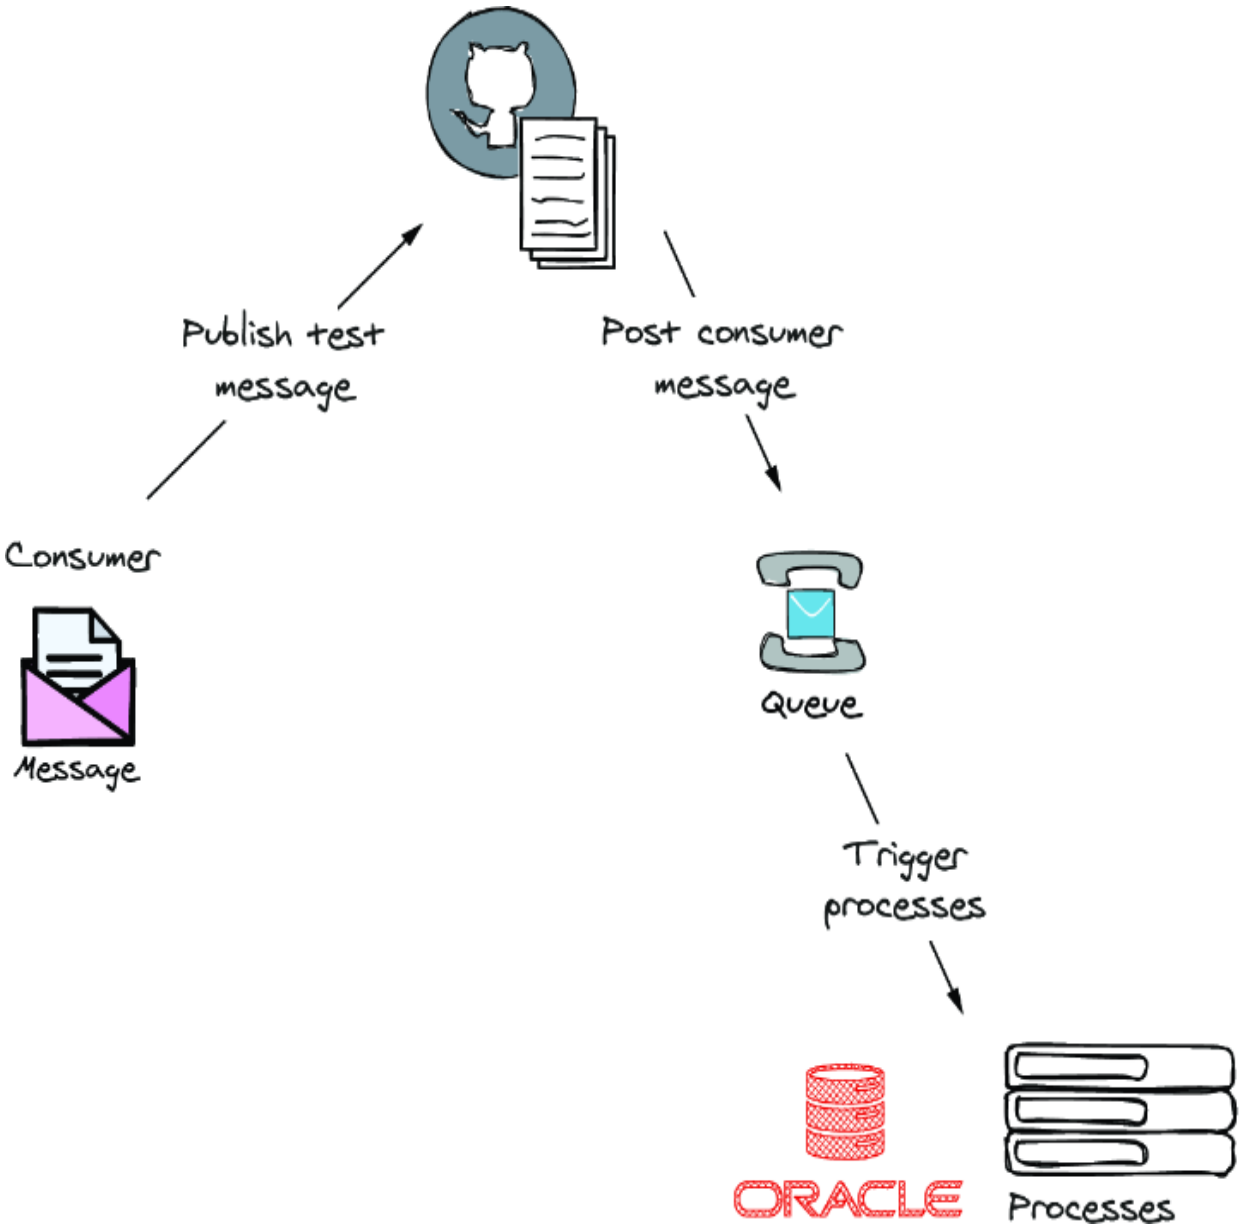

Figure 3.9 The consumer publishes a test message to GitHub. The consumer message is posted onto a queue that triggers the Oracle database processes.

This example shows how the contract testing flow can be applied simply using a GitHub repository and some custom code. Creating the boundaries of responsibility regarding who is in charge of testing each part of the end-to-end flow clarified things.

We've already mentioned the contract testing Pact framework as this will be the tool we use during the implementation chapters. However, there are other tools available, and more have been appearing in the market recently,
