Figure 3.13 Pact Broker compares the consumer mocks with the OpenAPI specification test results to verify the contract.

Finally, the web application can check the contract verification status within its CI pipeline and determine whether deploying the app changes is safe, as shown in figure 3.14.

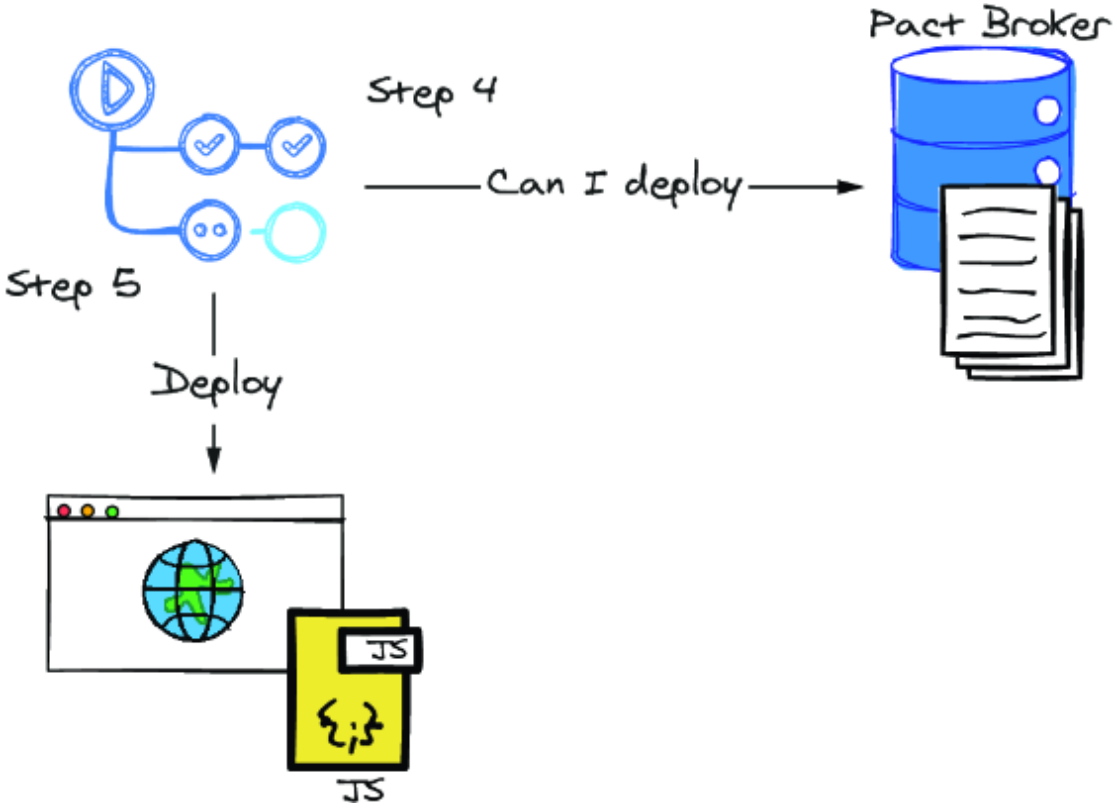

Figure 3.14 Using the can-i-deploy tool to verify the contract changes and deploy the web application

BENEFITS OF PDCT

With PDCT, existing mocks and stubs are used to generate contracts with minimal additional time and effort. PDCT also reduces the learning curve for teams that can adapt their existing mental models to include contract testing. Other benefits include the following:

- The ability to adopt contract testing with all integrated systems that expose an OpenAPI specification
- A natural progression for teams already using schema assertions
