- The broker is the central location for storing and keeping consumer and provider aligned.
- The contract testing life cycle integrates with the consumer and the provider CI workflows via a contract store.
- The PDCT life cycle passes a contract between teams, enabling confidence in integrations stably and reliably.
- Contract and schema testing tools aim to provide the framework and infrastructure across multiple languages and communication types.
- Pact is the most popular contract testing framework to implement PDCT, and PactFlow (team plan) supports PDCT.
- GraphQL requests are supported by wrapping the GraphQL layer.
- Event-driven systems are supported by mocking the message body independent of the messaging technology.
