MOVIES.JSON

To simplify the movies API's data source, the movies API in our example doesn't connect to a database. Instead, the movies API returns static data from a basic JSON file. The sample JSON file is found by expanding the data folder on your GitHub project. You should see a file named movies.json with the following content:

```
[
  { "id": 1, "name": "The Shawshank Redemption", "year": 1994 },
  { "id": 2, "name": "The Dark Knight", "year": 2008 },
  { "id": 3, "name": "Amelie", "year": 2001 },
  { "id": 4, "name": "Fight Club", "year": 1994 },
  { "id": 5, "name": "The Lion King", "year": 1994 }
]
```

MOVIES.JS

If you expand the provider folder on your GitHub project, you should also see a file named movies.js, which represents a movie and should have the following code:

```
class Movie {
  constructor() {
    this.movies = [];
  }

  getMovies() {
    return this.movies;
  }

  getMovieById(id) {
    return this.movies.find((movie) => parseInt(id) == movie.id);
  }

  getMovieByName(name) {
    return this.movies.find(movie => movie.name === name)
  }

  insertMovie(movie) {
    this.movies.push(movie);
  }

  getFirstMovie() {
    return this.movies[0];
  }
}

module.exports = Movie;
```
