PROVIDER-SERVICE.JS

Finally, the file provider-service.js acts as our main entry point. It exposes the provider.js, calls the function to import the data, starts the server, and listens on the available port for connections:

```
const { server, importData } = require('./provider');
const port = process.env.PORT || 3000;

importData();

server.listen(port, () => console.log(`Listening on port ${port}...`));
```

To start, install the project dependencies by running `npm install` on your terminal. Once everything is installed, start the provider service locally by typing the following command:

```
npm run start:provider
```

Running the command should print the following message:

```
Listening on port 3001...
```

`start:provider` is a custom script that we've added within the scripts section of the package.json file, which contains the following command:

```
"scripts": {
    "start:provider": "cross-env PORT=3001 node provider/provider-service.js"
  }
```

The preceding command specifies an environment variable called `PORT` and sets the value to `3001`. We use the `cross-env` module to make sure that this command works regardless of the operating system you're using, especially if you're using a Windows machine. Then, using the `node` command, you're simply executing the code specified in the provider-service.js class. If you then open up your browser of choice and type in `localhost:3001/movies`, you should see the list of movies returned:
