And for each movie, it should return the ID, name, and the year it was released.

2. **Scenario: Get a single movie**

   Given there is a movies API

   When the consumer fetches a single movie

   Then the movies API should return a status code of 200

   And the ID, name, and year the movie was released.

3. **Scenario: Add a new movie**

   Given there is a movies API

   When the consumer adds a new movie by specifying the movie name and date

   Then the movies API should accept the movie

   And return a status code of 201.

4. **Scenario: Add an existing movie**

   Given there is a movies API

   When the consumer adds an existing movie by specifying the movie name and date

   Then the movies API should return a status code of 409

   And the movies API should return a suitable error message.

5. **Scenario: Delete a nonexistent movie**

   Given there is a movies API

   When the consumer deletes a new movie that doesn't exist

   Then the movies API should return a status code of 404

   And the movies API should return a suitable error message.

6. **Scenario: Delete an existing movie**

   Given there is a movies API

   When the consumer deletes an existing movie

   Then the movies API should return a status code of 200.

All these scenarios are great candidates for contract testing because they define the consumer's expectations from the data provider. The scenarios don't detail the provider's functional implementation because the
