4.3.5 Other programming languages

While we've chosen how to write consumer contract tests in JavaScript, Pact supports other programming languages as well, such as Java, C#, Ruby, and Python. Please refer to https://docs.pact.io/implementation_guides/ for specific implementations of Pact with other programming languages.

4.4 Publishing the contract to Pact Broker

After the contract is generated, the contract needs to be uploaded to a central place, called Pact Broker, as described in section 3.4. You can host your own Pact Broker, but for this example, we'll show you how to use PactFlow (https://pactflow.io/).

PactFlow is a fully managed Pact Broker to help you and your teams get started with Pact easily. PactFlow comes with a free starter plan that you can use (see chapter 9 to understand the difference between PactFlow and open source Pact Broker). It comes with managing up to two contracts and unlimited users. To get started, please sign up for a free starter plan account (https://pactflow.io/try-for-free/), and follow the instructions. Once you have an account, you should see an example landing page similar to figure 4.7.
