to make the change on their side. Once the API is deployed to a test environment and the mobile app Android Package Kit (APK) is available, then the misalignment will be detected. Figure 5.1 demonstrates how contracts can stray. Think about scenarios you've experienced that would benefit from a consumer contract test being implemented. This is a simple example but shows the importance of CDCT. Providing early feedback on these incidents can save time and reduce rework.

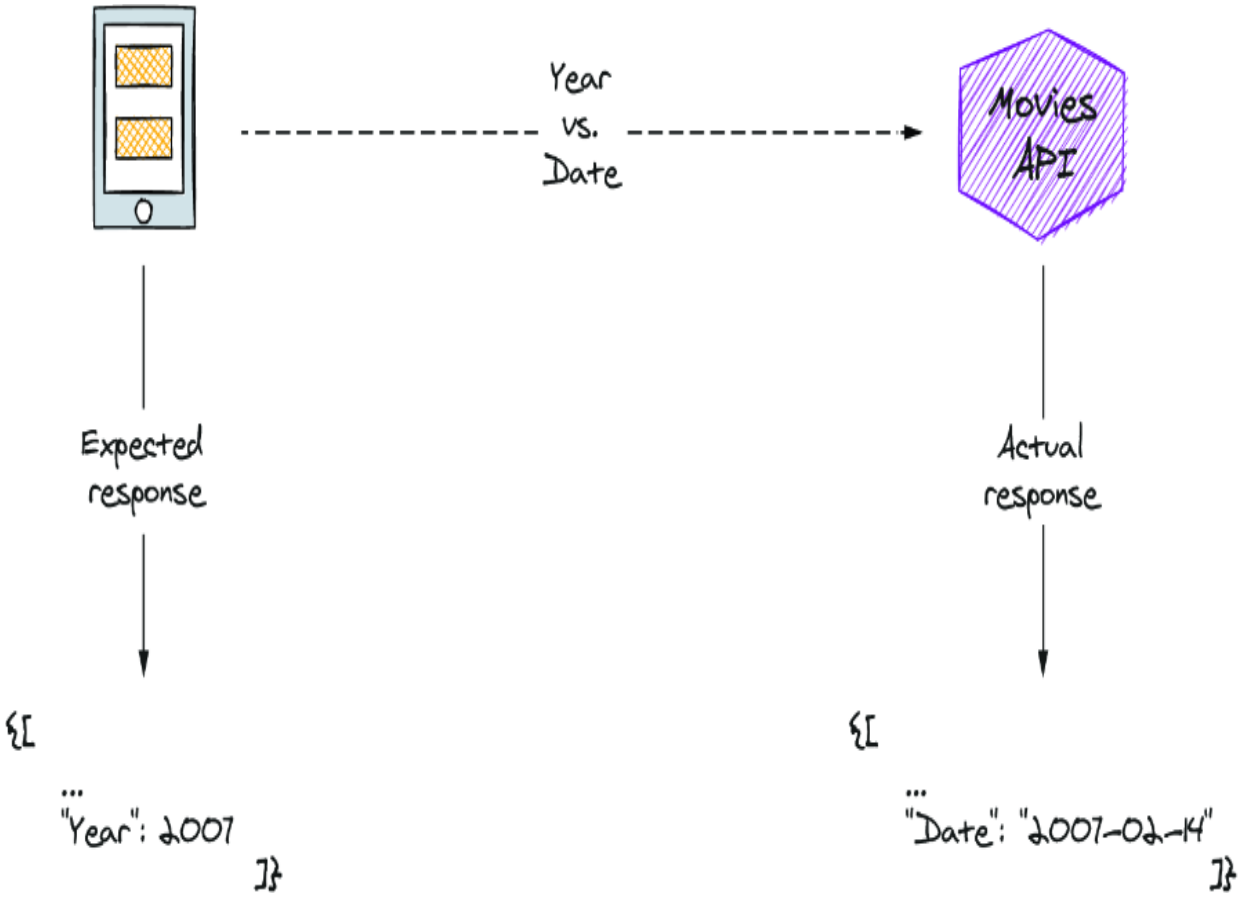

Figure 5.1 Mobile expected response with `Year` field and movies API actual response with `Date` field

In this chapter, we'll use CDCT for the following scenarios from the movies API:

1. **Scenario: Get all movies**

   Given a movie exists

   When a request is made to `GET` all movies

   Then the movies API should return 200 status code
