And the movies API response should return the ID, name, and year.

2. **Scenario: Add a new movie**

   Given the movie doesn't exist

   When a `POST` request is made to add a new movie

   And body includes the movie name and release date

   Then the movies API should return 201 status code.

5.1 Pact consumer setup for Android apps

Throughout the chapter, we'll reference a mobile app that searches via an API call to get a list of movies. We'll focus on the data layer of the mobile app, which communicates with the API service. We're not experts in mobile app development, so use the code in this chapter for reference, and apply your knowledge appropriately in your project.

In this chapter, we explain what you need regarding dependencies, test annotations, and all the intricacies of consumer Pact tests. We'll use the pact-jvm (https://github.com/pact-foundation/pact-jvm) implementation of the consumer-driven contract library Pact. Dependencies will be implemented using Gradle and Kotlin. The tests are written using the JUnit 5 framework. You can follow along with the code in the project repository (https://github.com/mdcruz/pact-js-example/).

5.1.1 Requirements

To follow along in this step-by-step tutorial, you need to have the following installed on your machine:

- Android Studio, Giraffe Version or above
- Git and access to GitHub

Navigate to the consumer-mobile folder in the GitHub project. The first thing we need is to add the dependencies to our Gradle project. build.gradle is implemented using Kotlin. First, import test logging for
