Listing 5.4 build.gradle tasks

```
tasks.withType<Test>().configureEach {
    useJUnitPlatform()
    testLogging {
      events(PASSED, SKIPPED, FAILED)
      exceptionFormat = FULL
      showExceptions = true
      showCauses = true
      showStackTraces = true
    }
    systemProperties["pact.writer.overwrite"] = true
}
```

5.1.2 Mobile app implementation

Now, we'll highlight some elements of the implementation within our example mobile app (located in the consumer-mobile folder in GitHub, https://mng.bz/n0KK). The code referenced in this section is only to provide some context for the implementation. Feel free to skip to section 5.2 if you want to jump to the Android consumer test implementation. For the mobile app implementation, let's look at the data layer within our mobile app (for reference in the GitHub example, see app/src/main/java/com/example/movie/data/repository/MovieRepositoryImpl.kt), as follows.

Listing 5.5 Movie repository implementation

```
class MovieRepositoryImpl @Inject
constructor(private val api: MovieAPI): IMovieRepository {
    override suspend fun getMovies(): MoviesDto {
        return MoviesDto(api.getMovies())
      }
    }
interface IMovieRepository {
    suspend fun getMovies(): MoviesDto
}
```

The implementation of the movie repository contains the API request to the external service. The constructor argument takes a `MovieAPI`-type object, as follows. The implementation contains one function, which gets all movies from the API.
