Listing 5.13 `createPact` function

```
import au.com.dius.pact.core.model.annotations.Pact

@Pact(provider = "MoviesAPI", consumer = "MoviesAndroidApp")
fun createPact(builder: PactDslWithProvider): V4Pact {
    val body: DslPart = PactDslJsonArray.arrayEachLike()
        .integerType("id")
        .stringType("name")
        .integerType("year")
        .closeObject()!!
    return builder
        .given("a movie exists")
        .uponReceiving("a request for all movies")
        .path("/movies")
        .method("GET")
        .willRespondWith()
        .status(200)
        .headers(mapOf("Content-type" to "application/json"))
        .body(body)
        .toPact(V4Pact::class.java)
}
```

The test starts with a test annotation like any other JUnit test, as shown in listing 5.14. Then, the `PactTestFor` annotation provides the glue to connect the Pact setup we did earlier. This Pact test annotation takes multiple arguments. First, the provider names the same `"MoviesAPI"` provider given earlier when creating the Pact interaction. The second argument is the Pact method, which connects the function we created earlier (refer to listing 5.9). The third argument is the provider type. In this example, we're using an HTTP request; therefore, the `SYNCH` type is required for synchronous type requests.

Listing 5.14 Pact Test

```
import au.com.dius.pact.consumer.MockServer
import au.com.dius.pact.consumer.junit5.PactTestFor
import au.com.dius.pact.consumer.junit5.ProviderType
import org.junit.jupiter.api.Test

@Test
@PactTestFor(providerName="MoviesAPI",
pactMethod = "createPact",
providerType = ProviderType.SYNCH)
fun `should get movies response`(mockServer: MockServer) {
```

The reason for having a test within Pact is to make sure that the interaction that was built within the `createPact` method matches the actual request that is made from the mobile app. Then, if everything aligns between them, the contract will be created. To make this comparison, the test function takes a mock server provided by the Pact consumer package. Pact
