```
            "combine": "AND",
            "matchers": [
              {
                "match": "integer"
              }
            ]
          },
          "$[*].name": {
            "combine": "AND",
            "matchers": [
              {
                "match": "type"
              }
            ]
          },
          "$[*].year": {
            "combine": "AND",
            "matchers": [
              {
                "match": "integer"
              }
            ]
          }
        }
      },
      "status": 200
    },
    "type": "Synchronous/HTTP"
  }
]
```

Finally, metadata is added to the Pact JSON file, which is taken from the package used and the Pact specification file format we defined.

Listing 5.18 Android Movie Pact, part 3

```
"metadata": {
  "pact-jvm": {
    "version": "4.3.15"
},
  "pactSpecification": {
    "version": "4.0"
  }
}
```

5.3.1 Pact matchers

Matchers are a key part of creating the mock objects within Pact (refer to section 4.1.3 for a detailed explanation). DSL matching methods range from generic string and integer types to specific date and IP address types. For more matcher types, see Pact JVM documentation (https://mng.bz/QVzj).
