If you want to learn more about matching specifics, Pact documentation provides a detailed overview (https://mng.bz/XVE6).

Listing 5.22 Match query parameters

```
.path("/movies")
.method("GET")
.matchQuery("id", "[a-z]+", "jaws")
```

5.3.2 Pact POST requests

In listing 5.21 earlier, we touched upon an example that used a `POST` method. Of course, a `POST` request requires a body to accompany the request. As with the response body shown in listing 5.13 previously, the same can be applied after the request HTTP method as shown in listing 5.23. The `body` method chains off the HTTP method and takes a JSON body or Pact DSL object.

Listing 5.23 Request body

```
.method("POST")
.body("{\"name\": \"Lion King\", \”date\”: \“2023-12-06\”}")
```
