5.4 Chapter exercise

Now that you have a complete overview of how to create a consumer contract with Pact JVM, you can try and write more consumer tests for the `POST` endpoint scenario that we've provided:

1. **Scenario: Add a new movie**

   Given the movie doesn't exist

   When a `POST` request is made to add a new movie

   And body includes the movie name and release date

   Then the movies API should return the 201 status code.

Listing 5.24 `POST` request to add movie

```
@Headers("Content-Type: application/json")     #1
@POST("/movies")
suspend fun addMovie(@Body movie: Add): JSONObject
override suspend fun addMovie(movie: Add): JSONObject {     #2
  api.addMovie(movie)
         return JSONObject()
   }

  data class Add(     #3
    override val name: String,
    override val year: Int
  )
```

#1 Function in file: data/remote/MovieAPI
#2 Function in file: data/repository/ MovieRepositoryImpl
#3 Class in file: domain/model/Movie

If you need any help, have a look at the main branch on GitHub in the consumer-mobile folder (https://mng.bz/n0KK).

Summary

- The Pact packages required to run Pact consumer tests include the Pact plugin and the Pact consumer test implementation dependency.
- Consumer contract tests target the data layer within Android mobile apps, implementing a modular architecture that improves contract testing testability.
