- The Pact Builder constructs the request data and response expectations, forming the contract test interactions for the provider.
- Pact tests with JUnit5 annotations generate contracts on completing a successful test run, represented in the Pact specification to be published to the Pact Broker.
- The PactV4 specification contains four main parts—consumer, provider, interactions, and metadata—enabling the improved support for matching features.
- Pact JVM matchers support URL paths, query parameters, headers, and body objects, allowing data flexibility for the provider for all dynamic values.
