As we first mentioned in chapter 2, contract testing allows the provider to develop features independently and safely. If the movies API introduces a new field, `reviewRating`, for a future feature that the web consumer doesn't need but a different consumer requires, then the provider contract test should be able to verify that the movies API can develop this feature safely.

However, a provider contract test shouldn't include tests verifying its business logic and other functionality. A different set of tests should cover the functionality, ideally on the unit level. For example, let's look at a different scenario where the consumer tries to add a movie. From a consumer perspective, their consumer contract tests should only be that when they add a new movie that doesn't exist, the provider should return the correct status code and that the new movie has been added successfully. If the provider has a few business rules regarding the movie's name, such as the character limit, then this needs to be covered as a separate unit test, as shown in table 6.1.

Table 6.1 Example business rules that should be covered in a unit test instead of a contract test

Business Rule	Unit	Contract
Movie name should have a minimum of 2 characters.	Yes	No
Movie name should have a maximum of 35 characters.	Yes	No
Movie name should only be alphanumeric.	Yes	No
Movie name shouldn't be empty.	Yes	Yes

Notice that a contract test covers the last business rule, which is also a major one. From a consumer perspective, this business rule makes the most sense for them, and they have built a shared understanding with the provider. If the other three business rules are also covered in a contract test, then if the provider changed their business rule that the movie name should now have a maximum of 30 characters instead of 35, the contract test will fail. Ideally, small changes in the business rules shouldn't break the contract with the consumers because it should have been picked up on the provider's unit tests. From a consumer perspective, they need to know how the provider responds if they send something wrong. All other
