1. Importing the required dependencies
2. Running the provider service
3. Setting up the provider verifier options
4. Writing the provider contract test
5. Running the provider contract test

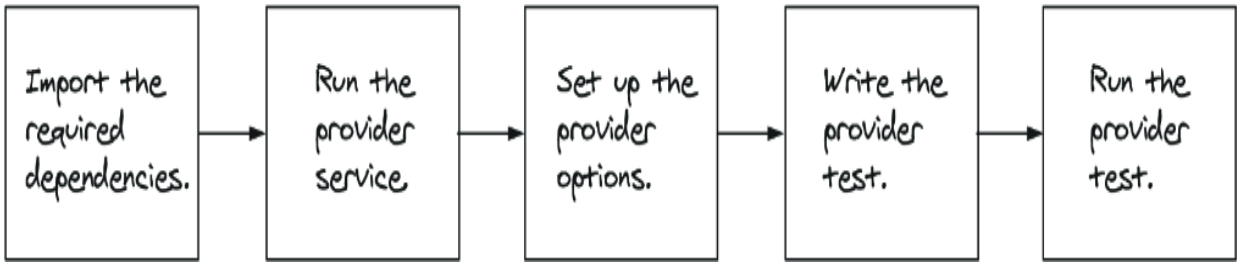

Figure 6.2 Steps in writing a provider contract test

IMPORTING THE REQUIRED DEPENDENCIES

In the provider folder, create a new file called provider-contract.spec.js, and add the following lines of code to import the required dependencies:

```
const { Verifier } = require('@pact-foundation/pact');
const { importData, server } = require('./provider')
```

First, we need the `Verifier` module from the Pact library. We also need the `importData` function and the `server` instance from the `provider.js` class.

RUNNING THE PROVIDER SERVICE

In a provider test, we need to make sure that the provider is up and running before we verify the contract. To start the provider as part of your test, add the following code after your import statements:

```
importData();

const port = '3001';
const app = server.listen(port, () => console.log(`Listening
on port ${port}...`));
```

This is essentially the same code found in provider-service.js. If you don’t want to add this code, an alternative is to open another terminal window
