1. Writing a new consumer contract test
2. Using a provider state
3. Running the consumer contract test
4. Uploading the new contract
5. Setting up a `stateHandler` on the provider codebase
6. Running the provider contract test

WRITING A NEW CONSUMER CONTRACT TEST

Let's start with structuring and adding a new test in the consumer-web/consumer-contract.spec.js file:

```
describe('When a GET request is made to a specific movie ID', () => {
    test('it should return a specific movie', async () => {

    });
  });
```

Within the `test` block, let's set up the new interaction that we want to register to the mock provider:

```
const EXPECTED_BODY = { id: 1, name: "My movie", year: 1999 };

...

const testId = 100;
EXPECTED_BODY.id = testId;

 provider
   .uponReceiving('a request to a specific movie')
   .withRequest({
      method: 'GET',
      path: `/movie/${testId}`,
    })
    .willRespondWith({
      status: 200,
      body: {
       id: integer(testId),
       name: string(EXPECTED_BODY.name),
       year: integer(EXPECTED_BODY.year)
      }
    });
```

This is similar to the first consumer contract test introduced in chapter 4, except we've updated the path to `/movie/${testId}`. Next, you need to import and call the function the consumer created that is responsible for
