fetching a specific movie and passing in the URL of the mock provider and the test ID. Once the `fetchSingleMovie` function is called, you need to verify that the actual data returned by the consumer matches the expected data:

```
const { fetchMovies, fetchSingleMovie } = require('./consumer');

...

await provider.executeTest(async mockProvider => {
  const movies = await fetchSingleMovie(mockProvider.url, testId);
  expect(movies).toEqual(EXPECTED_BODY);
});
```

USING A PROVIDER STATE

To use a provider state, you need to call the `given` method and pass in the name of the provider state and any arguments we want to pass. The naming of the provider state is important because this needs to be the same name from the provider side:

```
provider
  .given('Has a movie with specific ID', { id: testId })
  .uponReceiving('a request to a specific movie')
  .withRequest({
    method: 'GET',
    path: `/movie/${testId}`,
  })
```

When Pact registers this interaction, it will also register the name of the provider state as well as any arguments the consumer passes. For your reference, the file consumer-web/consumer-contract.spec.js should now look like this:
