```
class MoviesApiPactTest {
  @Pact(provider = "MoviesAPI",
consumer = "movies-android-app")     #1

  ...

}
```

#1 MoviesAPI provider name as part of the mobile consumer contract setup

If you also remember from the provider verification setup, we also used the same provider name when we defined the provider options:

```
const options = {
  provider: 'MoviesAPI',     #1
  ...
};

const verifier = new Verifier(options);
```

#1 MoviesAPI provider name as part of the provider verification setup

When the provider verification is run, all contracts associated with the `MoviesAPI` provider will be pulled down from the Pact Broker and run against the local `MoviesAPI` service. This is one of the many benefits of using a Pact Broker because the provider can pull the relevant contracts they need to verify from different teams, ensuring that their contracts are verified before the provider pushes any of their changes to production.
