Part 3 covers implementing provider-driven contact testing (CDCT) and migrate integration tests to contract tests:

- Chapter 11 explains how to implement provider-driven contract tests with PactFlow using the Cypress, WireMock, Dredd, and Postman tools.
- Chapter 12 provides guidance on finding suitable integration or end-to-end tests that can be migrated to contract tests and how to refactor them.

We recommend that you start by reading the first three chapters so that you have a strong understanding of the core concepts. From there, choose whichever consumer test chapter is relevant for the tech stack, followed by chapter 6 for provider tests. Then, pick up from chapter 9 to set up Pact Broker. Those working on greenfield projects can skip chapter 12, as there shouldn't be any legacy test code to refactor (very lucky people).

About the code

Source code for the examples in this book is available for download from GitHub at https://github.com/mdcruz/pact-js-example. The main tools used in this book—Pact, PactFlow, and GitHub Actions—have active communities and support. For community support on the open source Pact framework, check out their documentation or join their slack channel (https://pact.io). For PactFlow, contact their sales or support team (https://pactflow.io). For support on GitHub Actions, checkout their documentation (https://docs.github.com/en/actions) or ask the GitHub community (https://github.com/orgs/community/discussions).

This book contains many examples of source code both in numbered listings and in line with normal text. In both cases, source code is formatted in a `fixed-width font like this` to separate it from ordinary text. Sometimes code is also **`in bold`** to highlight code that has changed from previous steps in the chapter, such as when a new feature adds to an existing line of code.
