kept everything in a single project just to make the learning experience a bit easier.

The contract testing approach that we'll follow in this chapter will introduce contract testing between a consumer and a GraphQL layer. So, in this case, the GraphQL layer will be the provider. However, with other projects we've worked on, we've also seen contract testing approaches where the GraphQL layer was the consumer and different data sources as providers. GraphQL as a consumer approach is also valid, but we'll focus on a consumer interacting with a GraphQL endpoint for this chapter.

> **Note** When GraphQL acts as the consumer, the same principles of contract testing that we've discussed in this book still apply.

7.2.1 GraphQL server overview

The GraphQL server consists of two important files:

- *data-source.js*—A file representing the data source for our GraphQL server, which at the moment, is the movies API. This file can be easily extended to also support other data sources.
- *graphql-server.js*—The main entry point to start the GraphQL server. The file consists of the GraphQL SDL, the resolver, and all the other setup to start our GraphQL server.

An overview of how the GraphQL server works is shown in figure 7.3.
