```
async function startServer() {
  const server = new ApolloServer({
    typeDefs,      #1
    resolvers,     #2
  });

  const { url } = await startStandaloneServer(server, {
    context: async () => {
      return {
        dataSources: {                 #3
          movieApi: new MovieAPI()     #3
        }                              #3
      } #3
    }
  });

  console.log(` GraphQL server ready at ${url}`);
}

startServer();     #4
```

#1 Our GraphQL schema via the typeDefs object
#2 Our GraphQL resolver via the resolvers object
#3 Our movieAPI data source to fetch the data
#4 Starts the GraphQL server

7.2.2 Running the GraphQL server

To run the GraphQL server, we've created a new script. Open your terminal, and run the following command:

```
npm install
npm run start:graphql:server
```

The command installs the package dependencies in case you haven't installed the dependencies required for this project and starts the GraphQL server. After running the command, you should see the following message printed to your terminal:

```
   GraphQL server ready at http://localhost:4000/
```

When you navigate to `http://localhost:4000/`, you should see the GraphQL Playground, as shown in figure 7.4. Feel free to run some example queries to familiarize yourself with the GraphQL Playground.
