you have an overview of both the GraphQL provider and consumer, let's begin writing our first consumer contract test for our GraphQL application!

7.3 Consumer contract tests between a consumer and GraphQL layer

Let's start writing the consumer contract test for scenario 1, as defined again here:

1. **Scenario: Get all movies**

   Given there is a movies API

   When the consumer fetches all movies

   Then the movies API should return a status code of 200

   And for each movie, it should return the ID, name, and year it was released.

Because GraphQL can be seen as a wrapper for our movies API, writing the consumer contract test follows the same pattern as a standard consumer contract test, as we've first explored in chapter 4. For familiarity, the steps to write the GraphQL consumer contract test will be broken down into the following steps:

1. Importing the required dependencies
2. Setting up the mock provider that the consumer will use
3. Registering the expectation that the consumer has against the provider to the mock provider
4. Verifying the consumer test, and generating the contract
5. Publishing the contract to the Pact Broker

7.3.1 Importing the required dependencies

In the consumer folder, create a new file called graphql-client-contract.spec.js, and add the following lines of code to import the required dependencies:
