provider and the directory for the contracts to be stored in the pacts folder of the current working directory. We're also passing the parameters to define the name of the GraphQL consumer and provider, which, in this example, are `GraphQLConsumer` and `GraphQLProvider`. These names will be used throughout the contract generation and when you upload the contract to Pact Broker.

To structure the outline of our test, the preceding code also adds a `describe` block, first introduced in chapter 4 and provided by the Jest testing framework, as well as a `beforeAll` block to set up the mock provider by calling `provider.setup()`.

7.3.3 Registering the consumer expectation

To register a new consumer expectation or interaction, we need to set up the mock provider with the correct consumer expectations. We can set this up by adding the following code after the first `beforeAll` block:
