Now, you’re ready to run the test! To run this test, let’s create a new script in our package.json file called **`test:graphql:consumer`**, which uses the `jest` command followed by the test file you want to execute:

```
"scripts": {
   "test:graphql:consumer": "jest
graphql/consumer/graphql-client-contract.spec.js"
 }
```

Make sure you save all the changes! To run the test, open your terminal, and type in the following command:

```
npm run test:graphql:consumer
```

If everything has been set up well, running this command should return one passing test and an output similar to that shown in figure 7.5.
