7.5 Chapter exercise

Now that you have a complete overview of how to perform contract testing with GraphQL, you can try writing more consumer tests for the following scenarios as part of the contract agreement and verifying them on the provider side:

1. **Scenario: Get a single movie**

   Given there is a movies API

   When the consumer fetches a single movie

   Then the movies API should return a status code of 200

   And the ID, name, and year the movie was released.

When you've written the additional tests, remember to update the `--consumer-app-version` manually as part of the `publish:contract` script, and then run the following commands in your terminal to run the consumer test, publish the contract, and run the provider verification:

```
npm run test:graphql:consumer
npm run publish:contract
npm run test:graphql:provider
```

You can also use the `afterAll` and `afterEach` blocks from Jest to avoid repeating any code duplication when it comes to verifying and generating the contract.

```
afterAll(() => provider.finalize());
afterEach(() => provider.verify());
```

When you finish this chapter, remember to commit all the changes you've introduced locally to your forked GitHub project. If you get stuck at any point, check out the file graphql/consumer/graphql-client-contract.spec.js from the main branch of the original GitHub project for assistance (https://github.com/mdcruz/pact-js-example/tree/main) or check out appendix C for the answers.
