Summary

- GraphQL is a new API standard that provides a more efficient, powerful, and flexible alternative to REST.
- Contract testing provides value to teams working with GraphQL because they can understand how consumers are using their data, what queries produce bad output, and what queries produce different status codes.
- Apollo is a collection of tools for working with GraphQL applications.
- To fetch data from REST APIs, use the `@apollo/datasource-rest` package to perform HTTP operations easily that can be used by your GraphQL server.
- The `apollo-server` package is an open source library for creating a server-side GraphQL.
- The `@apollo/client` package is an open source library for creating a client-side GraphQL and provides built-in integration with React, a popular JavaScript framework for building web applications.
- Pact provides support for GraphQL contract testing through the `GraphQLInteraction` wrapper.
