

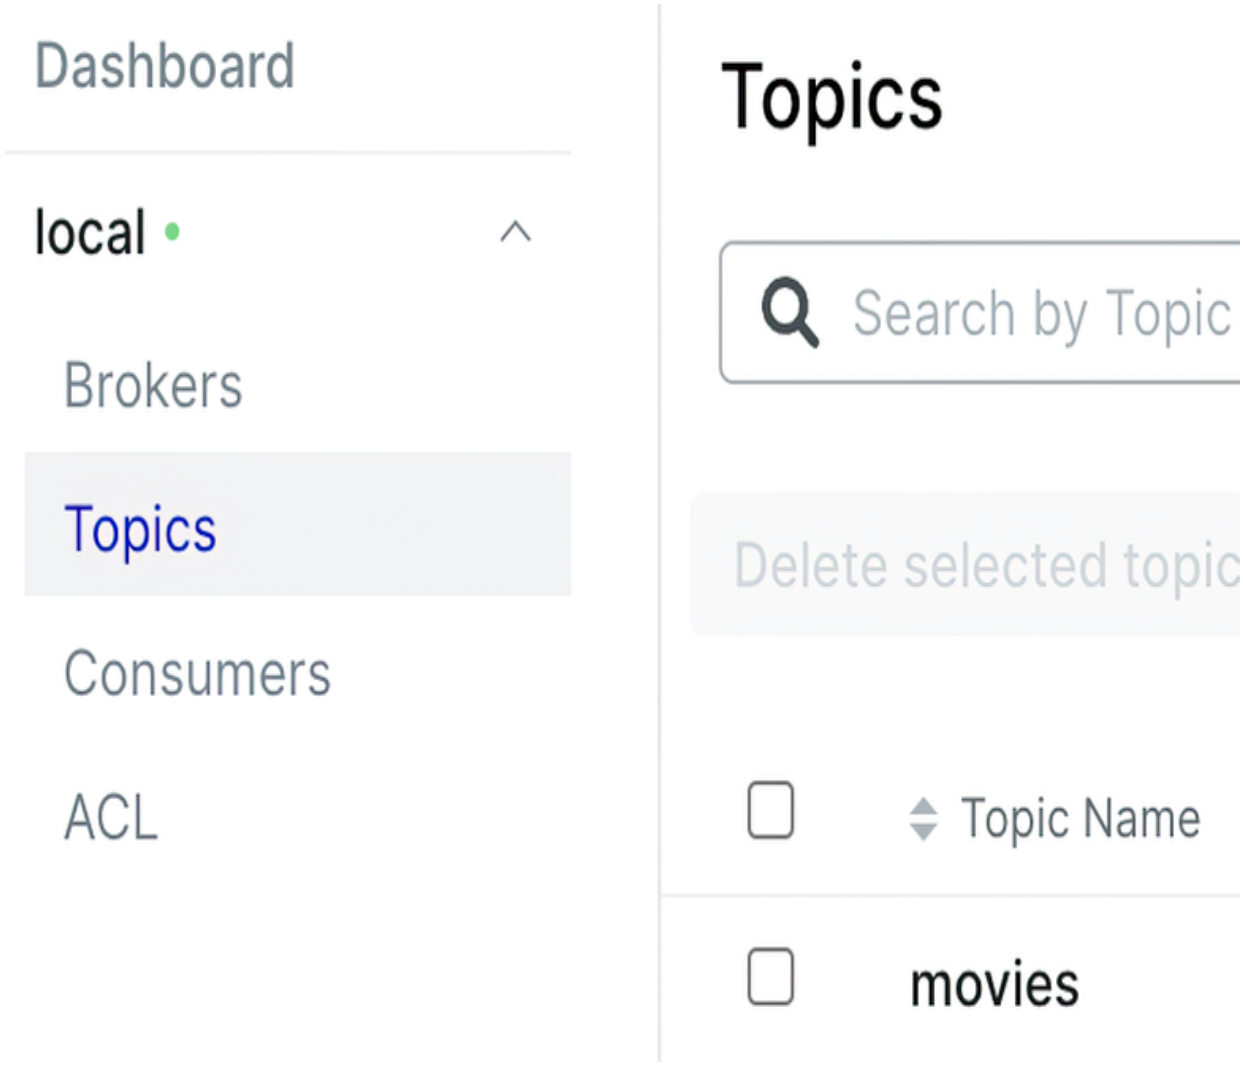

Figure 8.6 The Kafka UI displays the "movies" topic waiting for messages to be produced, proving the Kafka cluster has been launched successfully.

To consume an event on the Kafka cluster for the "movies" topic, you can run the following package script:

```
consume:kafka:message
```

The consuming server implementation, as shown in listing 8.6, shows how the service consumes the event by subscribing to the topic and listening to events published on the topic.
