8.4 Event handler consumer test implementation

Now, we'll implement the contract tests for the consumer event. We'll show how the implementation of the message and movie event handler are directly connected in the contract tests. This means that any change to the event handler implementation within the service will automatically change the test implementation as well. The important thing to take from the movie messaging service is the fact that the message and handler implementation that is used within the test is the same that is used within the service. The only difference is the Kafka service has been replaced by the Pact mock server. The Pact consumer test has been added next to the movie.handler file (but can be added wherever your Jest tests are placed), shown in figure 8.7.

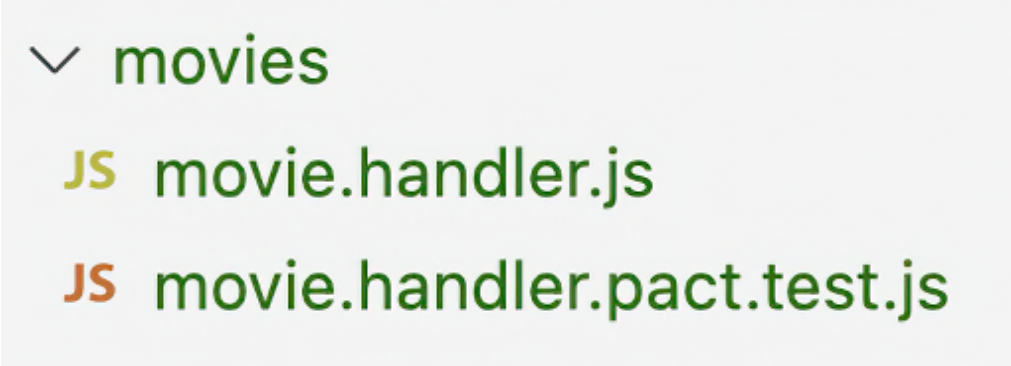

Figure 8.7 Movie handler and pact movie handler tests next to each other in the movies folder structure

Once the test file has been created, the class needs imports with the Pact message function and asynchronous message handler, as shown in the following listing. In addition, the relative path to the movie handler function is referenced and imports any Pact matchers to be used.

Listing 8.8 Pact handler test imports

```
const {
  MatchersV3,
  MessageConsumerPact,
  asynchronousBodyHandler,
} = require("@pact-foundation/pact");
const movieEventHandler = require('./movie.handler');
const { like } = MatchersV3;
const path = require("path");
```
