previously in listing 8.9. The verification step will generate the pact contract if it's successful.

Listing 8.14 Movie event handler test

```
it("accepts a movie event", () => {
  return messagePact
  .expectsToReceive("a movie add event")
  .withContent({
    name: like("The World's End"),
    year: like("2013")
  })
  .withMetadata({
    "contentType": "application/json",
    "kafka_topic": "movies",
  })
  .verify(asynchronousBodyHandler(movieEventHandler));
});
```

The next section will look at running the consumer test to generate the Pact contract.

8.5 Event consumer contract generation

Running the test in the console with the script command `npm run test:event:consumer`, you should see the word PASS in green on your screen, as shown in figure 8.10.

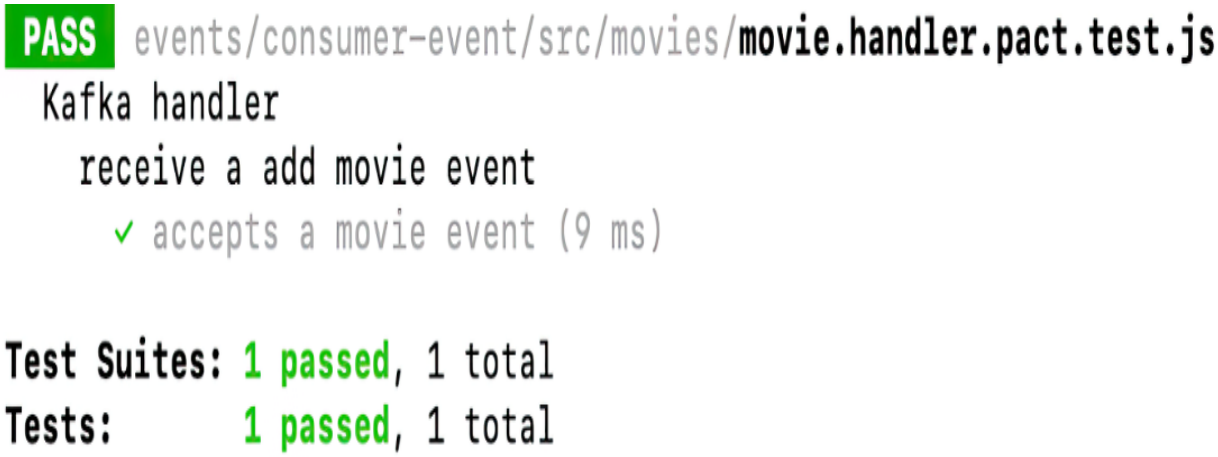

Figure 8.10 Console output showing the Pact Kafka handler test has passed

On completion of the test, if you get the PASS word next to the test, then the Pact file should have been written to the pacts folder at the root of the project, as shown in figure 8.11.
