

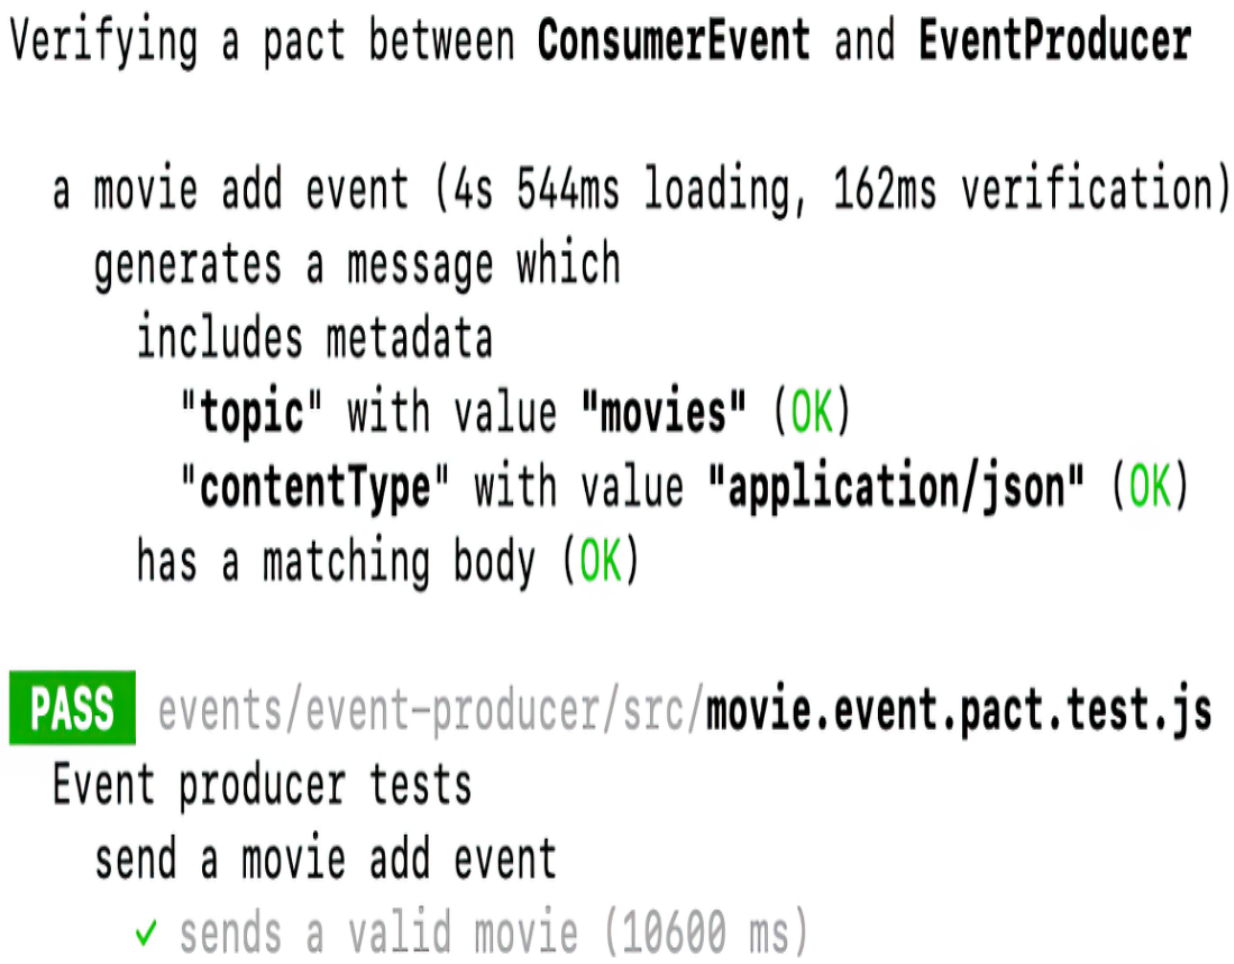

Figure 8.16 Movies event producer test run output, showing successful verification of the contract, including the metadata and body content

Summary

- In an event-driven setting, the subscriber to the event topic is the consumer, and the producer of the event is the provider, forming the contract testing relationship.
- Pact supports event messages as part of the core pact-js package to be used alongside JavaScript test frameworks.
- The Pact builder constructs the contents data and metadata expectations, creating the contract test messages for the producer.
- Pact message tests generate contracts on completing a successful test run, represented within the messages array in the Pact specification.
