Table 9.1 Pros (+) and cons (–) for each form of Pact Broker.

SaaS (PactFlow)	Own Storage Solution	Open Source
– Higher running costs	+ Low setup costs	+ Low setup costs
+ Easy setup and free account	+ No barrier to getting started	– Infrastructure needs to be provisioned and configured
+ Secure authentication	+ Slots into existing secure infrastructure	– Only username and password authentication method
+ Additional features including (OpenAPI specification support)	– Lack of out-of-the-box contract testing features	+ Simple UI and core consumer contract testing features

Option 1 is crafting your own contract storage solution, which removes the barriers to getting started with contracting testing. Using your existing storage solutions, such as Amazon S3 in Amazon Web Services (AWS) or a Git repository in GitHub, reduces the overhead of maintaining more infrastructure. However, storing the contracts in a storage location doesn't provide the benefits of a tailored contract testing solution. We aren't going to elaborate on this option further within this chapter, but it was mentioned before in chapter 3, and a replica of figure 3.9 is provided in figure 9.6. This example showed how the message contracts are published to a GitHub repository and then downloaded from the repository to test the contract.
