Figure 9.8 PactFlow order form for a free starter plan to set up a hosted Pact Broker

Once the account has been created, you should see an example contract on the homepage. The contract was between MyConsumer and MyProvider. Once the account has been set up, it's ready to receive contracts from the consumers.

9.3.2 PactFlow API token

To publish contracts to Pact Broker, you'll need the following:

- Broker URL
- Broker API token

The Pact Broker base URL can be seen in the browser address bar (e.g., https://mariecruz.pactFlow.io/) or copied from the API tokens page. The Pact Broker API token can be found in the settings (<URL>/settings/api-tokens) as shown in figure 9.9; then, copy the Read/Write Token when publishing or verifying contracts. The token with write permissions is reserved to be used within the CI pipeline, whereas the Read Only Token is only for the provider to test locally.
