in production. In this scenario, the API provider makes a breaking change to their API, requiring a new major version. Therefore, two versions of the API are supported during this time. The consumer web app is still pointing to the old API version, so we'll need to update the version in the URL, for example, /version/1.0.0. In chapter 6, we touched on a scenario with a breaking change, as shown in figure 9.10. The old version, the V1.0.0 `"year"` field, has been changed to `"date"`. Therefore, while the consumer web app is still displaying Year only on the UI, they will point to /pacts/provider/APIProvider/consumer/WebConsumer/1.0.0 in Pact Broker.

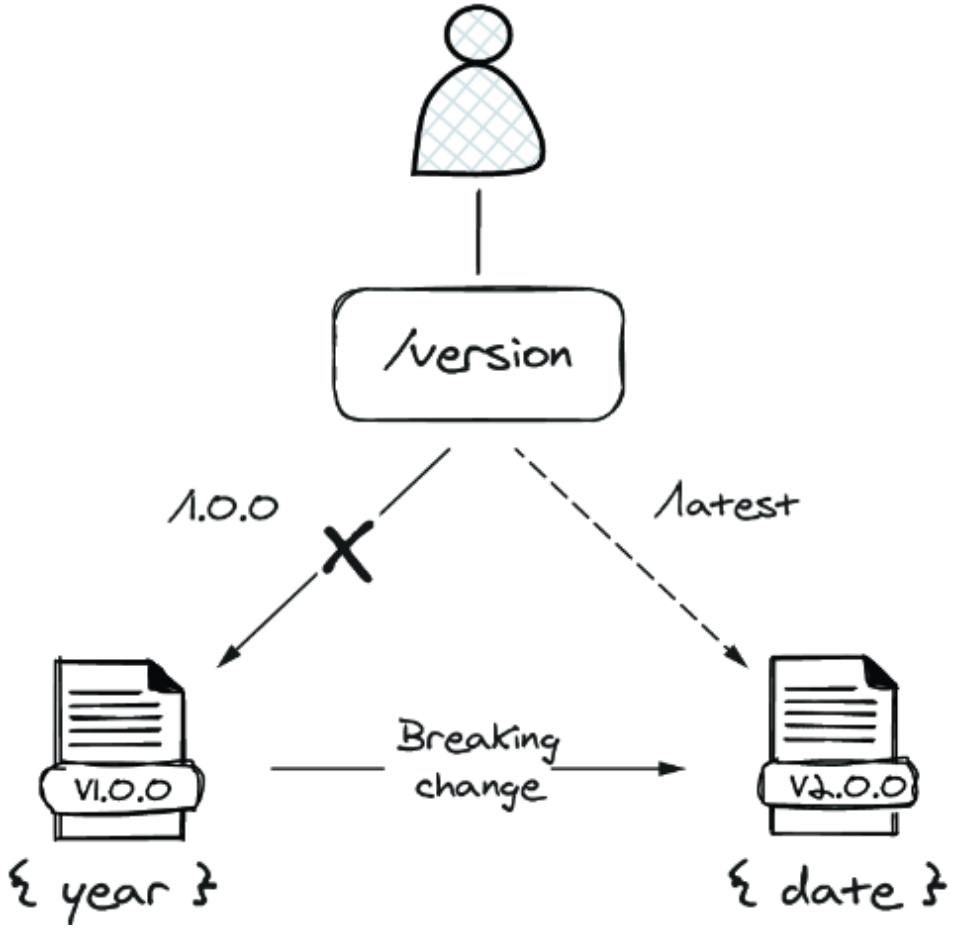

Figure 9.10 Pact Broker shows consumers updating their version after a breaking change to the contract.

Now we're all set up with PactFlow, so we'll move on to user management.
