

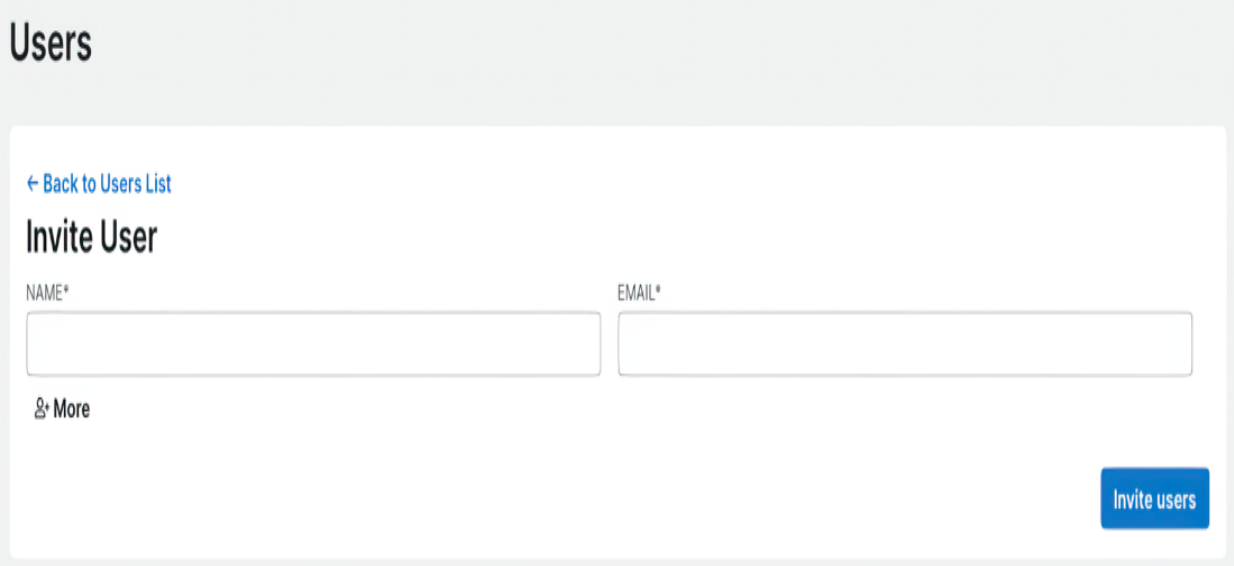

Figure 9.12 Invite new users to PactFlow to view Pact contracts.

Users can have different roles, as mentioned regarding the CI user. Types of roles include the following:

- Viewer
- CI/CD
- Administrator

Most users only need viewer permissions to help debug contract problems or see different contract versions. The CI/CD role will allow actions such as publishing and verifying contracts. Finally, the administrator role will be in charge of actions such as user management and API token rotation.

9.3.4 Other PactFlow features

PactFlow's core feature is sharing and verifying contracts, but there are a couple of other things that add value to the contract testing process. Following are some features we'll mention due to their effect on projects we've been involved with:

- Stubs
- Provider verification badges
