9.4.1 Pact Broker with Docker

The Docker images offer the core functionality for Pact Broker just by running a single command. A prerequisite to running the image is having Docker (https://docs.docker.com/get-docker/) installed on the server. There are a couple of options for images to consider for Pact Broker:

- pactfoundation/pact-broker
- dius/pact-broker

We've chosen to use the DiUS version of Pact Broker, as it offers some resiliency by restarting processes if the broker were to crash. The dockerized Pact Broker has a dependency on a PostgreSQL database. Therefore, we've chosen to use Docker Compose (docker-compose file) to run the service. The docker-compose file contains the DiUS Pact Broker and PostgreSQL database services, as follows.
