10.1 Basic CI/CD setup for the consumer and provider

As mentioned, we use GitHub Actions to demonstrate how you can set up your contract tests as part of a pipeline. GitHub Actions is a CI/CD platform that you can use to automate your build, test, and deployment pipeline. If you're more familiar with other CI/CD platforms, getting started with GitHub Actions is fairly easy and quick. All you need is a GitHub repository! We only show the basics here, but if you want to know more about GitHub Actions in detail, check out https://docs.github.com/en/actions.

Because the example project found in https://github.com/mdcruz/pact-js-example contains both the consumer and provider code for simplicity, we show only one workflow. In real-world projects, there will be at least two workflows: one for the consumer project and one for the provider project. The basic workflow will be similar regardless and is shown in figure 10.1.

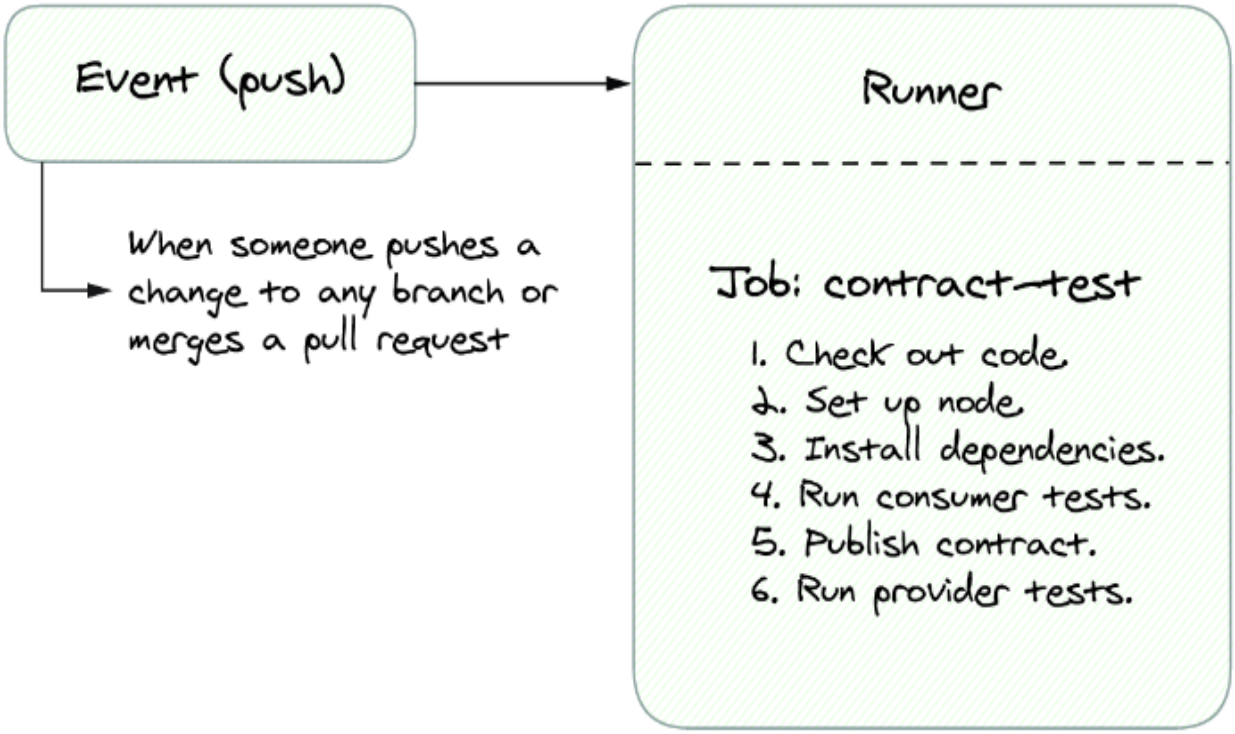

Figure 10.1 A simple visualization of the contract testing workflow via GitHub Actions. This runs the web consumer tests, publishes the contract, and runs the provider verification test.
