The workflow is triggered whenever someone pushes changes to any branch or merges a pull request to the main branch. This trigger can also be customized depending on your project needs. For the basic workflow, we define only one job, which is to run the contract testing workflow, but this job can be run sequentially or in parallel with other jobs. The steps in our `contract-test` job include the following:

1. Checking out the GitHub project so the workflow can access it
2. Setting up the Node action so dependencies can be cached
3. Installing the project dependencies added to your package.json file
4. Running the web consumer tests
5. Publishing the contract to PactFlow
6. Running the provider tests

The npm commands for steps 3-6 in the preceding list were introduced in previous chapters already, so there is nothing new here. Steps 1 and 2 are standard actions provided by GitHub.

10.1.1 Setting up GitHub Actions

To set up GitHub Actions in your own GitHub projects, you just need to create a workflow file of type YAML in a directory called .github/workflows. If you check out the basic-ci-setup branch of the example GitHub project, you should see a file named contract-test-sample.yaml inside the .github/workflows directory, and it should contain the following content:
