When the workflow completes, log in to your PactFlow account, select the WebConsumer and MoviesAPI integration, and click Matrix to view the matrix table. You should see a screen similar to figure 10.3 where the consumer version is now a unique identifier instead, which we can link to a specific GitHub commit.

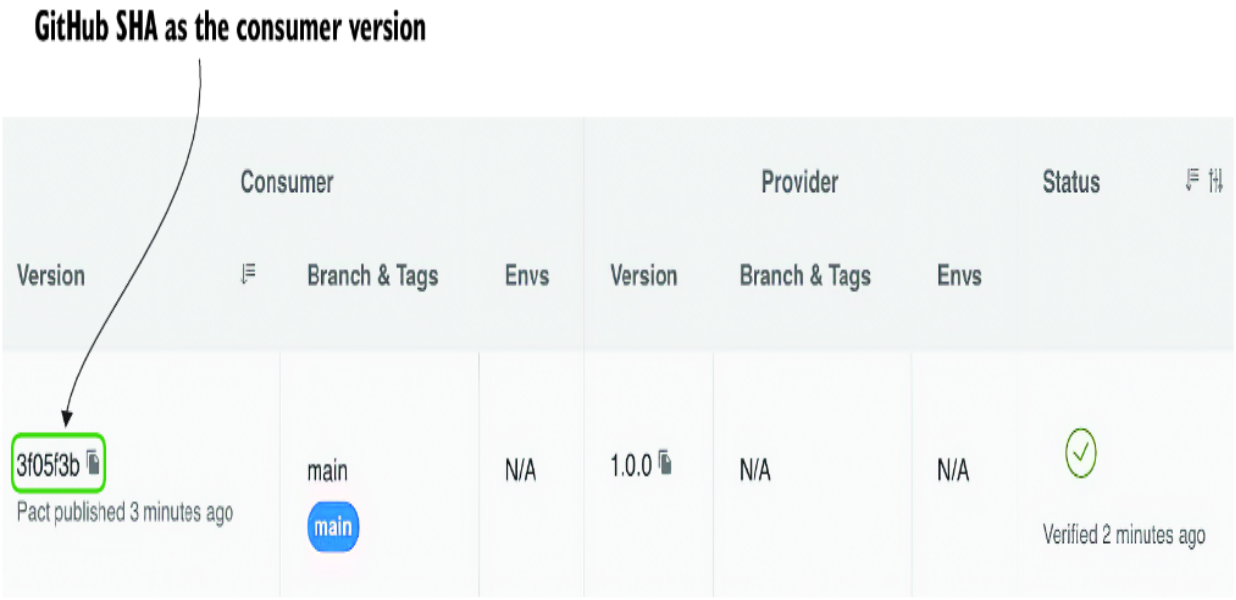

Figure 10.3 Matrix table for WebConsumer and MoviesAPI integration. The consumer version is now set to the GitHub SHA instead of a manual version.

Let's update the MoviesAPI provider versions to use the GitHub SHA by updating the provider/provider-contract-spec.js file. Within the provider options of this file, update the value of `providerVersion` to use the `GITHUB_SHA` environment variable:

```
const options = {
  …
  pactBrokerUrl: process.env.PACT_BROKER_BASE_URL,
  pactBrokerToken: process.env.PACT_BROKER_TOKEN,
  providerVersion: process.env.GITHUB_SHA,
  …
}
```

Go ahead and save all the changes. Once you push the changes to your remote branch and the workflow completes, head back to your PactFlow account, and you should now see a screen similar to figure 10.4.
