To use this branch when publishing a contract from the consumer side, you need to update command `publish:pact` again in the package.json file and replace the `tag` option with `branch`:

```
"scripts": {
     "publish:pact": "pact-broker publish ./pacts
--consumer-app-version=$GITHUB_SHA
--branch=$GITHUB_BRANCH
--broker-base-url=$PACT_BROKER_BASE_URL
--broker-token=$PACT_BROKER_TOKEN"
}
```

To test the workflow as part of the pipeline, commit the changes again to your local GitHub branch, and push the changes remotely to your own fork. When the workflow completes, go back to your PactFlow account, select the WebConsumer and MoviesAPI integration, and on the Overview tab, you should see a screen similar to figure 10.5, where there are now two contracts verified successfully: one for the pull request branch and one for the main branch. In your case, the branch name should be setup-advanced-pact-features. You can also test the new workflow locally by replacing `--branch=$GITHUB_BRANCH` with `--branch=setup-advanced-pact-features`, and then, on your terminal, run command `npm run publish:pact` to publish the contract.
