

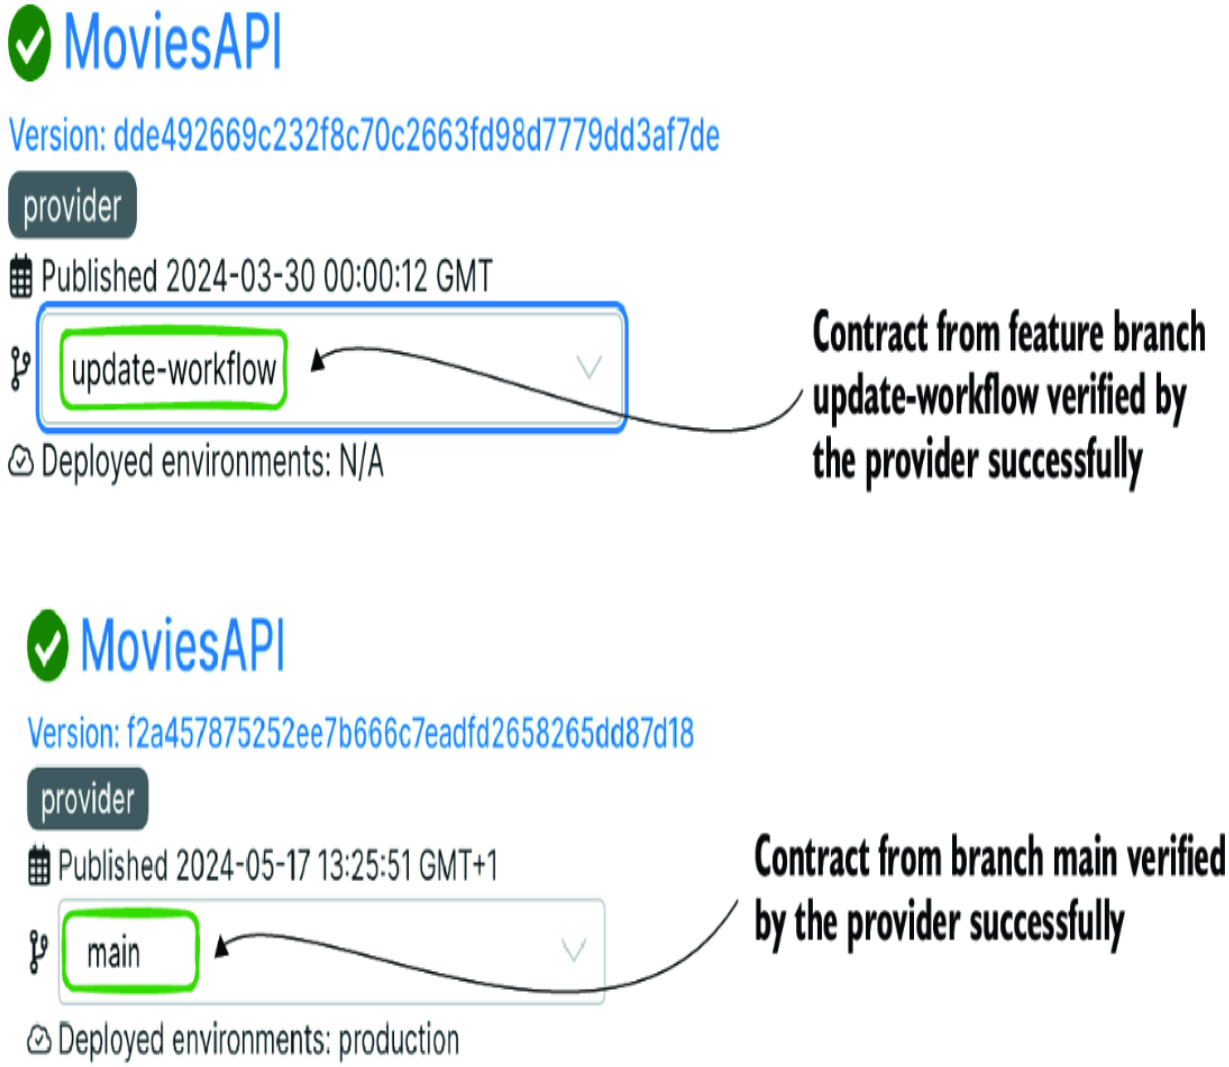

Figure 10.5 Two contracts from the WebConsumer to represent a contract generated from a feature branch and the main contract that has been merged to the main branch. Branches allow providers to verify the correct contracts.

Now that we've configured branches in the consumer pipeline, we do the same for the provider pipeline. To configure a branch when the provider verifies the contract, we add additional options to the provider setup. For now, just update provider/provider-contract-spec.js.

Within the provider options, remove `consumerVersionTags` and add two new options: `providerVersionBranch` and `consumerVersionSelectors`.
