The `providerVersionBranch` will have the `GITHUB_BRANCH` environment variable to represent the branch to which it belongs. The `consumerVersionSelectors` is a mechanism introduced by Pact to represent which contracts the provider should verify and contain different properties. In our example, we want to ensure that the provider verifies the contract from the consumer's main branch to catch any contract problems before the provider merges their changes, so we need to set the `mainBranch` property to `true`. Because we now use `consumerVersionSelectors`, we don't need `consumerVersionTags` anymore.

If both consumer and provider teams work on the same feature, a recommended practice is to have the provider branch name match the branch name the consumer used. This means if the developer on the consumer side created a new branch called test-pact-features, the developer from the provider side should also create the same branch name. To enable the matching branch rule, we must set the `matchingBranch` property to `true` by adding the following code snippet:

```
const options = {
  …
  providerVersion: process.env.GITHUB_SHA,
  providerVersionBranch: process.env.GITHUB_BRANCH,
  consumerVersionSelectors: [
    { mainBranch: true },
    { matchingBranch: true },
  ]
  …
}
```

There are other properties for `consumerVersionSelectors`, so make sure to check out https://mng.bz/2gdd to see the full list.

To test the new workflow, commit the changes again to your local GitHub branch, and push the changes remotely to your own fork. If you go back to your PactFlow account, you should see a screen similar to figure 10.6 where the branch name is also configured on the provider side, and the provider is verifying two contracts: one from the matching branch name and one from the main branch. In your case, the branch name should be setup-advanced-pact-features. Similarly, you can also test the changes locally by replacing `providerVersionBranch: process.env.GITHUB_BRANCH` with `providerVersionBranch: setup-advanced-pact-features`,
