Using figure 10.7 as a reference, let’s say that branch feat-123 is good to go and ready to be deployed to production. Before merging this branch, it’s a good idea to make sure that the environment structure you have is also recorded in Pact. For example, if your build pipeline includes deploying to three different environments (e.g., test, staging, and production), these three environments should also be created in Pact.

It’s worth noting that Pact already prerecords default environments test and production. However, if you want to create a new environment to reflect your process better, this can also be done in a couple of ways:

- Using the `pact-broker` command, which comes built-in after installing Pact
- Using PactFlow’s UI

As an example, if you want to create a new environment called staging using the `pact-broker` command, go back to your terminal and use the following command:

```
pact-broker create-environment --name staging --display-name staging
```

After running the command, you should see an output similar to:

```
Created staging environment in PactFlow
with UUID 88d7bce9-e5b0-49b8-827f-1d16a5621f4b
```

To see the newly created environment, go back to your PactFlow account, click the Settings button, and then select the Environments tab. You should land on the environments screen shown in figure 10.8.
