```
jobs:
  contract-test:
    runs-on: ubuntu-latest
    steps:
      ...
      - name: Run provider contract tests
        run: npm run test:provider
      - name: Record web consumer deployment
        if: github.ref == 'refs/heads/main'
        run: npm run record:web:consumer:deployment
      - name: Record provider deployment
        if: github.ref == 'refs/heads/main'
        run: npm run record:provider:deployment
```

To test the new workflow, commit the changes again to your local GitHub branch, and push the changes remotely to your own fork. You might notice that the new steps will be skipped because of the conditional statement added, so to test that it’s working, merge the pull request to your main branch. Once the workflow has finished running, go back to your PactFlow account, and on the WebConsumer and MoviesAPI integration overview, you should see an output similar to figure 10.10.
