Similarly, you can also test the changes locally by replacing `$GITHUB_SHA` with your consumer version value and running command `npm run can:i:deploy:consumer` on your terminal. If the version you provide doesn't exist, Pact will complain that there are no contracts or verification published. On the other hand, if the version you provided fails the can-i-deploy check, Pact will complain that the verification provided for the version was unsuccessful, and the step will fail.

At this stage, the contract testing workflow has been further improved and provides additional confidence that any changes merged are ready to be deployed without any contract problems. The CI/CD setup that we have now is illustrated in figure 10.14.
