

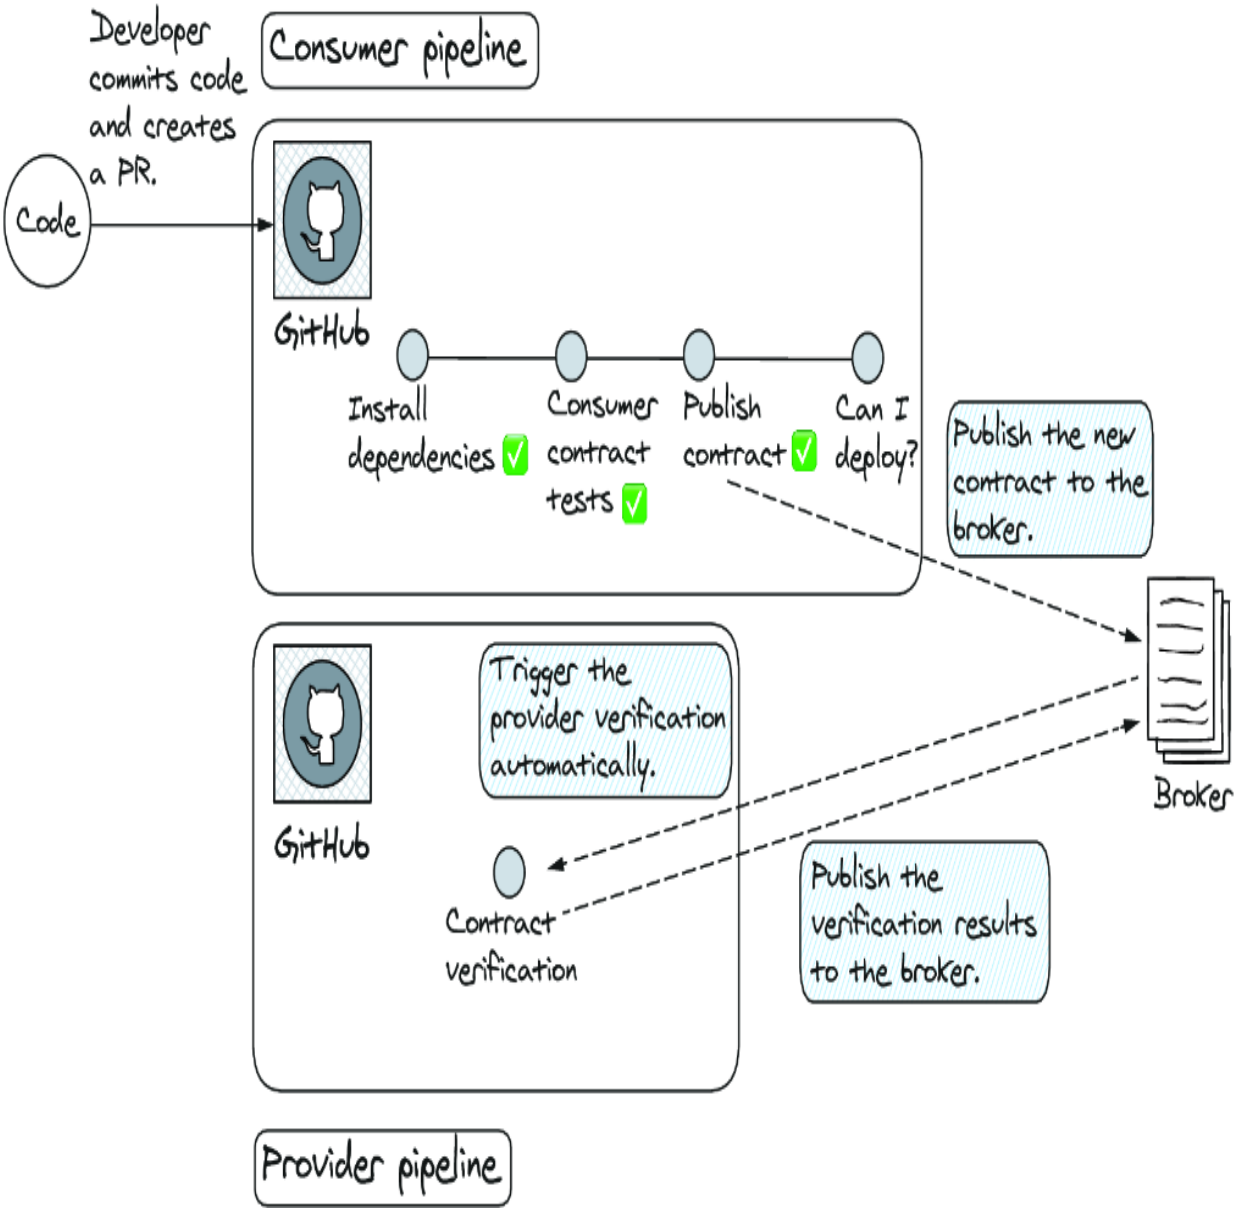

Figure 10.15 Consumer and provider pipeline in different GitHub projects. When a consumer publishes a contract that has changed, this should trigger the provider verification job from the provider pipeline.

For the webhook to be triggered, Pact needs to listen to some events. In this chapter, we only focus on the event type triggered when a new contract is published with changed expectations, which is the "contract requiring verification published" event. If you want to know what other event types Pact supports, check out https://docs.pact.io/pact_broker/webhooks#events.

To demonstrate how webhooks work, we've created a separate GitHub project containing only the web consumer code, which you can access
