here: https://github.com/mdcruz/consumer-example. The provider code still remains in the existing GitHub project at https://github.com/mdcruz/pact-js-example. In the following sections, we guide you through how to set up a Pact webhook so you can also apply it to your work projects.

10.4.1 Creating the Pact webhook

A Pact webhook can be created via the PactFlow UI or via the `pact-broker` command. Creating a webhook consists of the following steps:

1. Creating a GitHub personal access token with the `public_repo` access granted
2. Adding the GitHub token to PactFlow
3. Creating the Pact webhook

We won't cover how to create a GitHub personal access token, but if you want a detailed explanation of how to do this, go to https://mng.bz/1adV.

ADD THE GITHUB TOKEN TO PACTFLOW

To add the GitHub token to PactFlow, go back to your PactFlow account, click the Settings button, select the Secrets tab, and then click the Create Secret button. You should see the page shown in figure 10.16. Enter a name such as `githubToken`, and then paste the personal access token you created from GitHub.
