CREATE THE PACT WEBHOOK VIA THE PACTFLOW UI

To create a webhook in the PactFlow UI, go back to your PactFlow account, click the Settings button, select the Webhooks tab, and then click the Add Webhook button. You must fill in a few fields when you're on the webhook screen. Let's walk through each field and the details you must provide.

- *Description*—The webhook description, for example, "Webhook for MoviesAPI provider".
- *Consumer dropdown*—The consumer that triggers the webhook. For now, set this to WebConsumer.
- *Provider dropdown*—The provider that is triggered by the webhook. For now, set this to MoviesAPI.
- *Events*—The event(s) that Pact needs to listen for to trigger the webhook. For now, select the Contract Published That Requires Verification checkbox.
- *URL*—The URL to send the webhook request to. For GitHub, this will follow the https://api.github.com/repos/<YOUR_GITHUB_ACCOUNT>/<REPO>/ format, for example, https://api.github.com/repos/mdcruz/pact-js-example/dispatches. If you cloned the GitHub project, make sure to use your own GitHub account instead of mdcruz.
- *Headers*—The headers to be added as part of the webhook request. This will be in a key:value pair and should have the following:

```
Content-Type: application/json
Accept: application/vnd.github.everest-preview+json
Authorization: Bearer ${user.githubToken}     #1
```

#1 The GitHub token that we added as a secret to PactFlow

- *Body*—The request body to be added as part of the webhook request. This will be in a JSON object format and should have the following:
